一. Software

1. easyboard：（version V178 or above）
2. Download link: http://sysolution.net/download/EasyBoard-win(v181).zip

Easyboard software for configure controller.
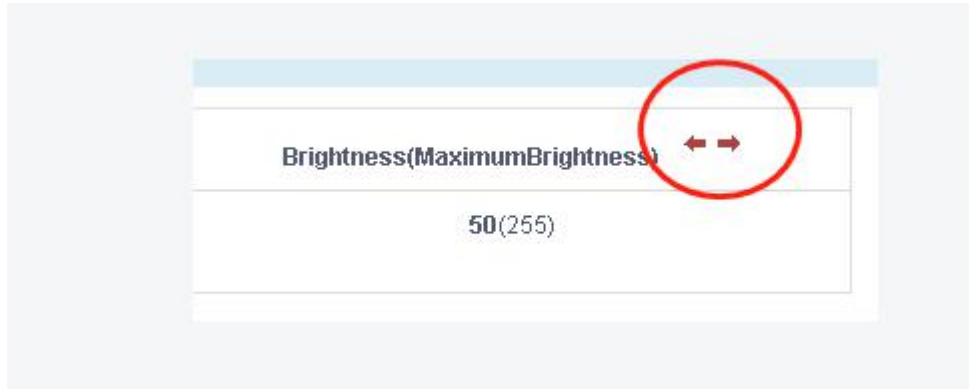

二. operations

1. Connect controller with laptop via Ethernet cable directly
2. Open Easyboard, click Detect IP on the left top and click ok, ok and then detect controller.

Detect controller success：
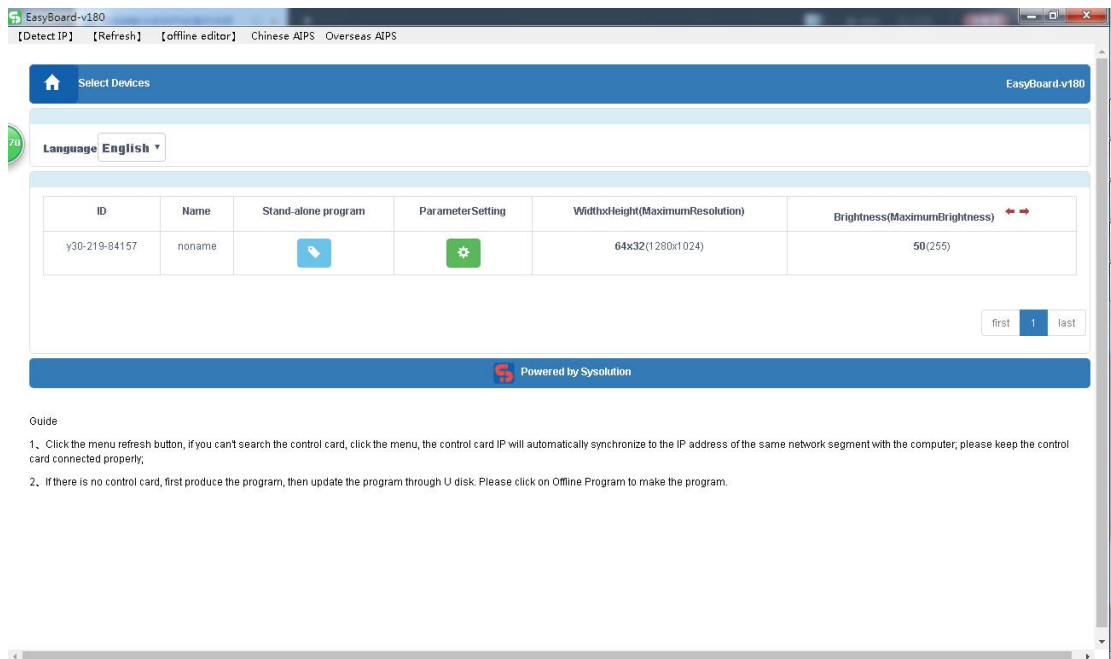

Click

then will see controller android version and IP address and other information.

NOTES: after detect controller IP, please double check the resolution has been setup, Hardware version is normal, if not, please refresh or restart the Easyboard software.

3. Stand alone program in Easyboard for sending image, video or Text to test screen display.
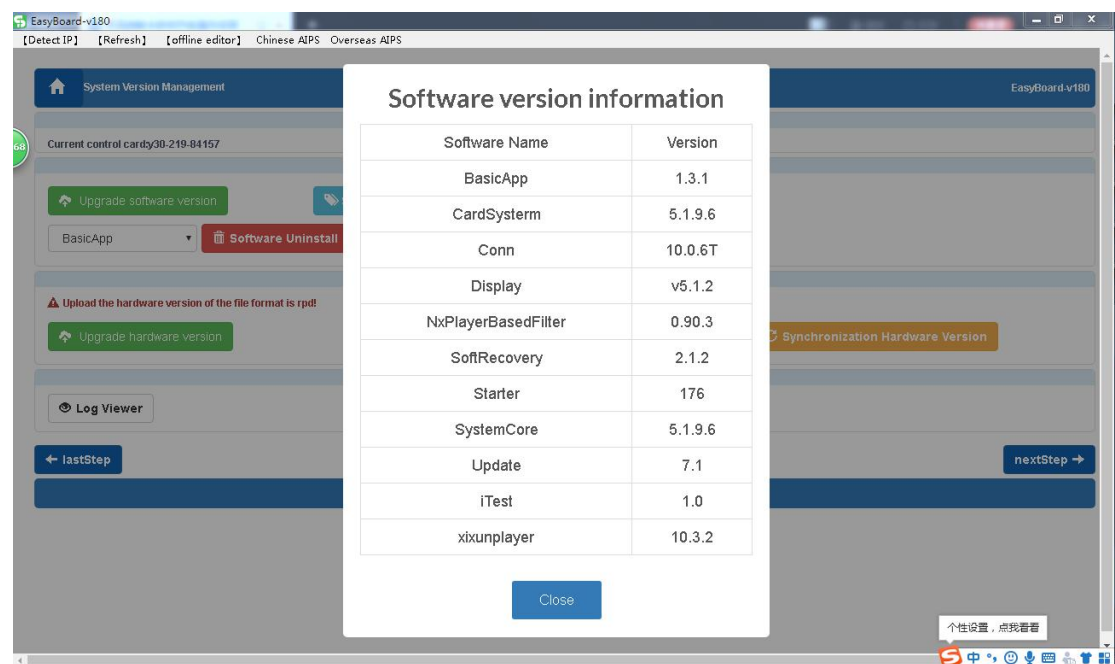

4. Parameter setting, default password 888 to enter configuration interface:
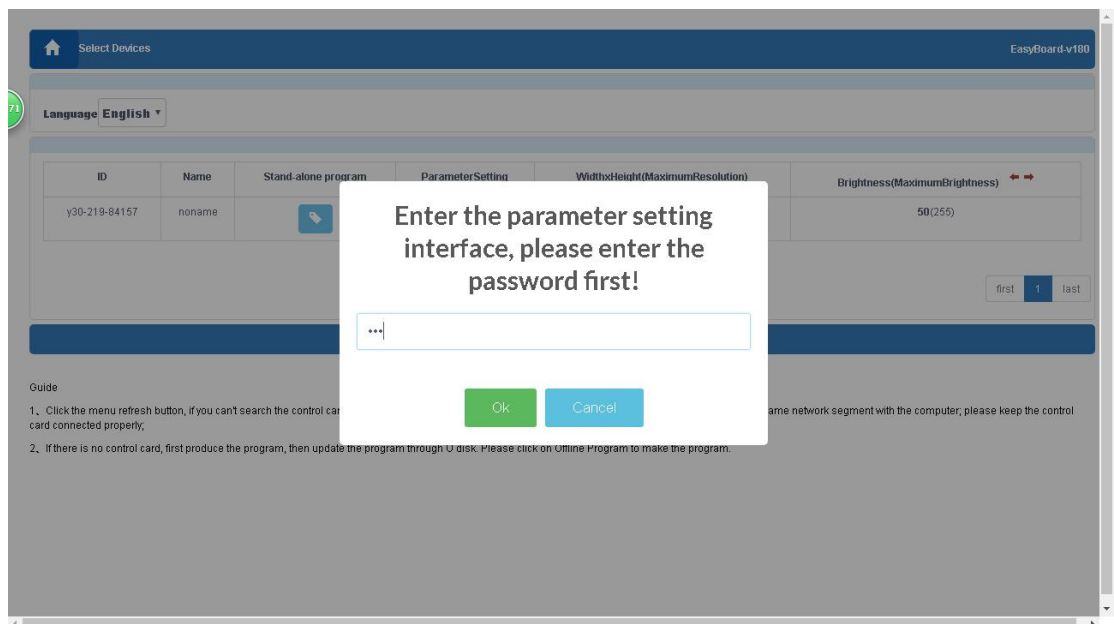

5.
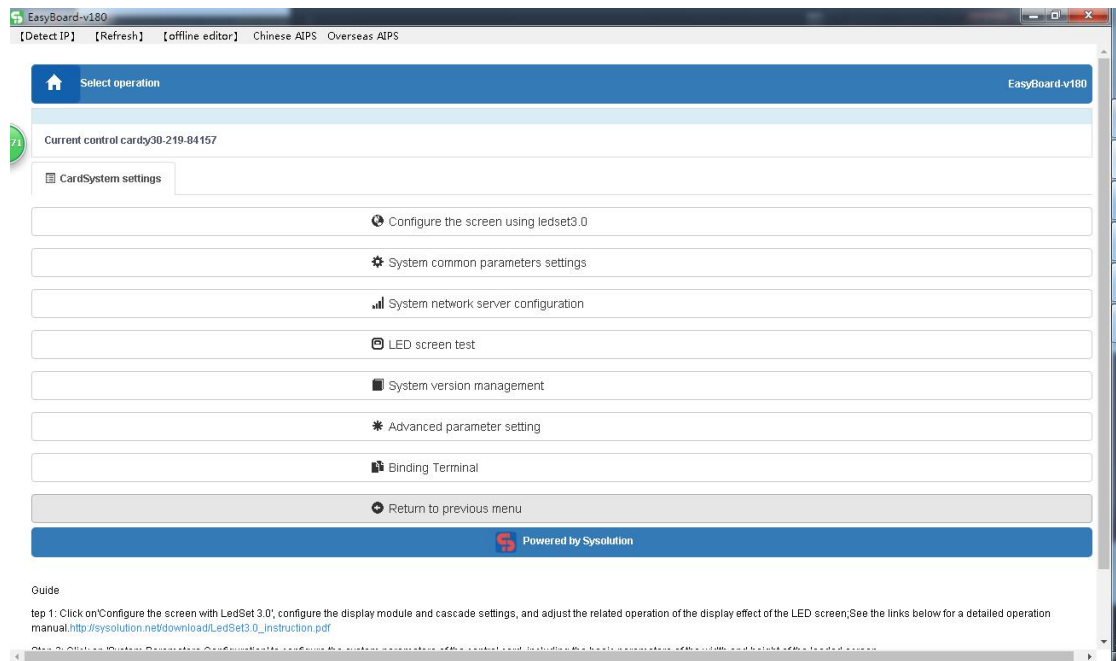

6. Go to system version management, query software version, will see following information

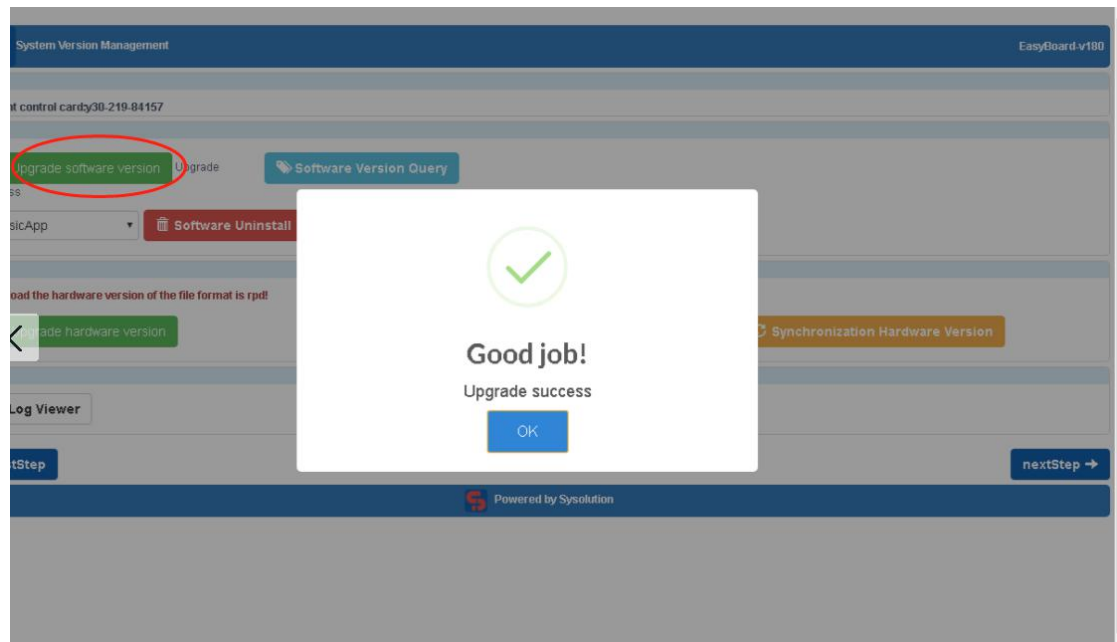

Y30 series controller has Display APK.

Y10 series controller do not has Display APK.

NOTES: If controller 's starter 176 and xixunplayer10.3.2 version or above, then no need update. If not, please do update.

Software version update:

System version management---> software update

Select the zip file and waiting for updating itself,

Network gateway setup:

Please follow the image to setup to make sure the controller has been setup with correct gateway and subnet mask

After set like this, it should be finished.

But for the IP address and gateway, subnet mask and DNS server, should be different for

different users.

Other TIPS：

1. Use separate power supply for sending controller like Y30 or Y10, 5V 3A.
2. After update software version, please restart controller by power off and on.
